Wireless communication network for big data capture and predictive maintenance in the context of Industry 4.0

Pierre Favrat, Ph. D.

Haute Ecole Spécialisée de Suisse occidentale

Fachhochschule Westschweiz

University of Applied Sciences and Arts Western Switzerland

University of Applied Sciences and Arts Western Switzerland

Our goals

- Perform condition monitoring and predictive maintenance using advanced analytics and Machine Learning in the cloud.
- Get useful and reliable data to the cloud from the factory floor -> how?

University of Applied Sciences and Arts Western Switzerland

It's complicated !

University of Applied Sciences and Arts Western Switzerland

And costly

University of Applied Sciences and Arts Western Switzerland

Challenges

- Usable data for analytics -> Event synchronization
- Big data -> Large bandwidth
 - Data must be compressed
 - Or data must be processed before transmission
- Wireless -> Battery powered & Low power
 - Custom design

Existing solutions ?

Problem

- Some machines require many sensors
- A floor can have many machines
- Carrier robots implies mobility

Requirements

- up to 100 sensors per machine
- Communication between machines
- Synchronized measurements
- Thousands measures/sec. per sensor
- 200 ms max. to transfer one sample
- Battery must last months or years

University of Applied Sciences and Arts Western Switzerland

Solution: LyraMesh

de Suisse occidentale

Fachhochschule Westschweiz

University of Applied Sciences and Arts Western Switzerland

Example: LyraSens in windmills
